ALIGNMENTS

The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives Theta defensin; antimicrobial; cyclic; bacterium; fungus; protozoan; virus; helminth; disinfectant; food preservative; analogue. Novel theta defensin peptide with antimicrobial activity against bacteria, yeast, fungi, protozoa and viruses. Ouellette AJ; Ā Claim 15; Fig 16; 110pp; English. Anti-viral, viral infection; theta-defensin; lipid environment; amphipathic alpha-helical structure; virucide; anti-HIV; immunisation; viral growth inhibitor; viral proliferation inhibitor. New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus. Anti-viral theta defensin peptide RTD-2 SEQ ID NO:28. Disclosure; Page 10; 65pp; English. The present invention describes a method (M1) of using a first anti-viral comprising a theta-defensin peptide in an amphipathic alphabatic peptide (I) comprising a theta-defensin peptide in an amphipathic alphabatic period a structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used for inhibiting the growth and consideration of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a VS. reducing virus band diving percentage of VS in a contaminated tissue or fluid sample safe for use, or reducing the number of population regardless of virus infection status, or inducing the number of infectious virus particles in a population of viruses. (M1) is useful for reducing the infectivity of a virus in sheep, cattle, horses, waine, cars, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who can infected with the virus, where the first anti-viral peptide is most preferably administered to a patient who is immunosuppressed to a subject who is cannotically, latently or acutely infected with the virus. The present sequence represents a rhesus monkey theta defensin anti-viral peptide, which is given in the exemplification of the present invention

Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.

Example 1; SEQ ID NO 2; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD03523-AD03527. The theta of detailed in the claims or appearing as AD03523-AD03527. The theta of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of growth. Thus the peptides are also useful for treating surfaces, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the hardmicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-2.

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabelic peptide (I) comprising a theta-defensin peptide in an amphipathic alphabelic structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucles and anti-HIV activities, and can be used for inhibiting the growth and conce virus growth, infectivity burden, shed, and development of anti-configuration of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus is spread within a virally-infected subject (V8), reducing virus shed from a V3, reducing percentage of VS in a v8, reducing virus shed from a V3, reducing secretical alterory in a v8, reducing virus shed from a V3, reducing virus and infection status, or inducing latency in a v8, (b) reducing the infectivity of a virus; and (c) rendering virus.

CC population regardless of viral infection status, or inducing latency in a v8; (b) reducing the infectivity of a virus; and (c) rendering virus enterties of infections virus particles in a population of viruses. Wanne, contaminated tissue or fluid sample safe for use, or reducing the infectivity of a virus in sheep, cattle, horses, swine, costs, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is contaministered prior to or subsequent to the virus contacting the subject who is contaministered prior to or subsequent to the virus contacting the subject who is contaminated peptide is most preferably administered to a subject who is contaminated by latently or acutely infected with the virus acutely infected with the virus acutely infected with the virus anti-viral peptide is encourably administered to a subject who is contaminated by a contaminate of the virus contacting the percent of sequence represents a chimeric human invess,

The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphababilitical structure in a lighd environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-HIV activities, and can be used to rival resistance. (I) can be used for inhibiting the growth and so can be used for inhibiting the growth and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus is shed from a VS, reducing percentage of VS in a virus shed from a VS, reducing percentage of VS in a population regardless of viral infection status, or inducing latency in a VS; (b) reducing the infectivity of a virus; and (c) rendering virus particles in a population of viruses. (M1) is useful for tractions virus particles in a population of viruses. (M1) is useful care reducing the infectivity of a virus in sheep, cartle, horses, swine, cats, fowl and humans e.g. an enveloped virus infection humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a partient who is immunosuppressed to a subject who is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is acquence represents a rheam monthly infected with the virus, preferably administered to a subject who is subject who is contacting the virus peptide is acquence represented a resume monkey theta defensin anti-viral peptide, which is given in the exemplification of the present invention of the present inven
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .
                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modalling and screening novel antiblotics. The invention is also useful in gene therapy. The present sequence is rhesus monkey theta defensin, RIDI peptide. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bacterial infection, human pathogen, holin, defensin,

This invention describes a novel conjugate for treating prokaryotic infections which comprises a transport mediator for passage through the prokaryotic cell membrane and a compound, directed against a prokaryote cand intended for introduction into it. The prokaryote is a bacterium, capecially one pathogenic in humans. The transport mediator is preferably a human peptide or protein, especially a phage-holin protein, its acrive cargament or variant or a defension. The introduced compound is a peptide nucleic acid (PNA) that inhibits a gene, especially one implicated in resistance to penicillin, tetracycline, ampicillin or kanamycin. The conjugate has the structure transport mediator-spacer-PNA where the spacer is poly(glycine and/or lysine), preferably containing 2-6 amino acids and the spacer is linked to the transport mediator through a cleavable disulfide bridge. The conjugates are administered together with an antibiotic, by parenteral, transdermal or subcutaneous routes. The products of the invention have antibacterial activity and are used, especially in combination with antibiotics, for treating prokaryotic, specifically bacterial, infections, especially where the pathogen is catabitate or easistance gene. Where the PNA is directed against the antibiotic resistance gene. Where the PNA is directed against consistant to co-administered antibiotics and then the bya is directed against constitute to co-administered antibiotics. 'e. 'old' antibiotics can be used successfully in cases where normally they would be ineffective. This sequence represents a cyclic defensin fragment described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

prostaglandin of the P-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intracoular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work symergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, ocular cell dysphasia, irritial melancyte hyperplasia, and hyperplasmation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rhesus theta defensin-1; RTD-1; bacteraemia; lipopolysaccharide; LPS; lipteitohnic acid; LTB, septic shock; antibacterial; fungicide; virucide; immunomodulator; anticoagulant activity; minomodulator; anticoagulant activity; microbial cell-wall biosynthesis; immunomodulation; anticoagulant.

This invention describes the novel use of rhesus theta defensin-1 (RTD-1) bacteraening a composition for treatment and/or prevention of bacteraenia for binding bacterial products such as lipopolysaccharide (LPS) and/or lipteichonic acid (LTA), or for treatment and/or prevention of septic shock. RTD-1, isolated from immune cells of rhesus monkeys, has antibacterial, fungicide, virucide, immunomodulator and anticoagulant activity. RTD-1 inhibits microbial cell-wall biosynthesis and also binds to LPS and LTA. RTD-1 is useful for treatment and prevention of severe infections caused by Gram-positive or negative bacteria and yeasts, or by viruses. RTD-1 combines four advantageous properties: a direct antimicrobial action, neutralisation of bacterial products (by binding), increasing release of tregulatory factors) and anticoagulant action, so provides a better and simpler treatment.
                                                                                                                                                                                                   Use of rhesus theta defensin-1 for treating or preventing bacteremia and septic shock, also for binding bacterial products and as immunomodulator and anticoagulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monkey, Rhesus theta defensin, RTD-1, antimicrobial peptide, cyclic, antimicrobial, antinflammatory, antibacterial, virucide, fungicide: food; contact lens solution, eye wash solution; inflammatory response, microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative, bacterial infection, viral infection; disinfectant; fungal infection; haemolytic activity.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of survival of microorganism as well as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or cod product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbisidal inhibition of survival of microorganism as well as incrobistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensing have betterial, viral, fungal or other infection. The theta defensing have high antimicrobial activity and low haemolytic activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monkey; Rhesus theta defensin; RTD; antimicrobial peptide; antimicrobial; antinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition; microbicatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; disinfectant; fungal infection; haemolytic activity.

defension analogue is useful for reducing as ADO35239-ADO35257. The theta defension analogue is useful for reducing or inhibiting growth or survival of a microcorganism in an environment capable of sustaining the growth or survival of the microcorganism and is useful for reducing or inhibiting or inhibiting growth or survival of a microcorganism in an environment such as food or food product, a solution (e.g., contact lens solution), or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbisidal inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from high antimicrobial activity and low haemolytic activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a theta defensin analogue defined by formulae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel theta defensin analog useful for reducing or inhibiting growth survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting or orbit of the microorganism in an environment such as food or survival of a microorganism in an environment such as food or coop product, a solution of a microorganism in an environment such as food or solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for the teating a patient suffering from the peptides are also useful for the teating a patient suffering from the peptides are also useful for the theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD03527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of survival of microorganisms as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from this antimicrobial activity and low haemolytic activity. The present section may be activity and low haemolytic activity. The present and the antimicrobial activity and low haemolytic activity. The present and activity and low haemolytic activity. The present and activity and low haemolytic activity. The present and activity and low haemolytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                  Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or coop product, a solution (e.g., contact lens solution, or eye wash colution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

The invention relates to novel retrocyclin peptides. Peptides and methods sof the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                 Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                          /note= "Linked to amino acid at position 18 to form cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually transmitted diseases, vaginosis.
                                                                                                                                                                                                                                                                                       /note= "Linked to amino acid at position 1 cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 93; DB 6; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           retrocyclin; cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy; microbial; viral; human.

The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic condending a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefension or retrocyclin to the cell; a method for killing microbial coranisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering restrocyclin to the microbial organisms; a method for administering restrocyclin as a microbial organism by administering nestrocyclin as a infection, and a method for administering retrocyclin as a prophlactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine infection such as HIV-1. The retrocyclin peptide can be used as a vaccine as therapeutic and prophlactic agents for treating and preventing as therapeutic and prophlactic agents for treating and prophlactic and control and viral infections. This sequence represents a retrocyclin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                         New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          retrocyclin; cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy;

Therrior further provides a cycle plot pettocyclin peptide. The intention further provides a cycle plot pettocyclin, an election in a cell by administering an effective dose of a circular infection in a cell by administering an effective dose of a circular minidefension or retrocyclin to the cell, a method for killing microbial organisms by administering an effective dose of retrocyclin to the organisms by administering an effective dose of retrocyclin to the organisms by administering an effective dose of retrocyclin as a therapeutic agent to a patient with an established microbial or viral infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine infection are defined by the peptide and polypeptides are useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections. This sequence represents a retrocyclin
                                                                                                                                                                                                                                                                                                                         New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Novel theta defensin peptide with antimicrobial activity against bacteria, yeast, fungi, protozoa and viruses. Example 1, Fig 2, 110pp, English

Novel theta defensin

The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment of bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives

The present invention describes a method (M1) of using a first anti-viral peptide (1) comprising a theta-defensin peptide in an amphipathic alpha-helical structure in a lipid environment for reducing the infectivity of a virus. (1) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti

containing subject from be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus spread within a virally-infected subject (VS), reducing virus burden in a VS, reducing virus series of virus infected subject (VS), reducing virus burden in a VS, reducing virus series of viral infection status, or inducing latency in a CO VS, (b) reducing the infectivity of a virus; and (c) rendering virus of VS, (b) reducing the infectivity of a virus; and (c) rendering virus of infections virus particles in a population of viruses. (M1) is useful CO VS, (b) and humans e.g. an enveloped virus infecting humans such as chann immunodeficiency virus (HIV). Preferably, the anti-viral peptide is containistered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is containistered by a latently or acutely infected with the virus. The present sequence represents a human thera defensin anti-viral peptide, which is given in the exemplification of the present invention \$

                                                                                              The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroiral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

                                                 The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular minidefensin or retrocyclin to the cell; a method for killing microbial organisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering sectionyclin as a therapeutic agent to a patient with an established microbial or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             retrocyclin; cyclic; primate; retroviral infection; circular minidefensin; antibacterial; virucide; vaccine; immunotherapy;

infection, and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and virucide activities. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                                                                                                                                                                          77.6%;

Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.

Claim 1; SEQ ID NO 23; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO35257. The theta defensin analogue is useful for reducing or inhibiting growth or survival

ö The present invention describes a method (M1) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alpha-helical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-viral resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing surface, or a mammal. The microbicidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as the rapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide. spread within a virally-infected subject (VS), reducing viral burden in a VS, reducing virus shed from a VS, reducing percentage of VS in a VS, reducing virus shed from a VS, reducing percentage of VS in a CS population regardless of viral infection status, or inducing latency in a VS, (b) reducing the infectivity of a virus; and (c) rendering virus-contaminated tissue or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is the chronically, latently or acutely infected with the virus. The present sequence represents a chimeric human/rhesus monkey theta defensin anti-viral peptide, which is given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     $55555555555555555555555888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
```

The invention describes new transplant compositions comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds. The media is capable of extending the preservation period past 72 hours and can provide organs with increased functionality upon transplant, animals receiving kidneys stored in the media of the present invention for either three or four days had serum

Claim 8; Page 28; 78pp; English

```
ô
creatinine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) alone. Lower serum creatinine levels are indicative of healthier kidneys and a more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures such as cardioplegia. It is contemplated that transplanted fhealthier organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial defensin peptide studied in the development of the transplant media
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Linked to amino acid at position 18 to form a cyclic structure"

The invention relates to novel retrocyclin peptides. Peptides and methods sof the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modalling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                                                                                                                                                                                                                                                           Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Linked to amino acid at position 18 to form a cyclic structure"

The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular mindefensin or retrocyclin to the cell; a method for killing microbial corganisms by administering an effective dose of retrocyclin to the microbial organisms; a method for administering restrocyclin as a therapeutic agent to a patient with an established microbial or viral infection; and method for administering restrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and infection such as HIV-1. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful microbial and viral infections. This sequence represents a retrocyclin peptide of the invention.
                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated retrocyclin peptides and cyclic polypeptides, useful as therapeutic and prophylactic agents for treating and preventing microbial and viral infections.
retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue

The present invention describes a method (MI) of using a first anti-viral comprising a theta-defensin peptide in an amphipathic alphace peptide (I) comprising a theta-defensin peptide in an amphipathic alphace peptide is structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HV activities, and can be used for includent and can be used for inhibiting the growth and conce virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a VS, reducing virus shed from a VS, reducing virus latency in a VS, reducing virus infections tatus, or inducing latency in a VS, (b) reducing the infectivity of a virus; and (c) rendering virus.

CC population regardless of viral infection status, or inducing latency in a CS infectious virus particles in a population of viruses. (MI) is useful of infectious virus particles in a population of viruses. (MI) is useful of reducing the infectivity of a virus; insheep, cattle, horses, swine, case, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is containistered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a patient whose the first anti-viral peptide is containistered to a patient whose the first anti-viral peptide is containistered to a patient whose the first anti-viral peptide is containistered to a patient where the first anti-viral peptide is containistered to a patient whose the first anti-viral peptide is contained by a patient whose the first anti-viral peptide is contacting the virus. The present section in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.
amphipathic alpha-helical structure; virucide; anti-HIV; immunisation; viral growth inhibitor; viral proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides theta defensin peptides and analogues which have antimicrobial activity. They can be used in the treatment bacterial, viral, fungal, protozoan and helminthic infections, in disinfectants and as food preservatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               22-JAN-2004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   object.
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism and is useful for reducing or inhibiting rowth or survival of the microorganism and is useful for reducing or inhibiting crowth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbictatic inhibition of survival of microorganism as well as the appended are also useful for treating a peptides are useful as the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for when the section in the present of the information of sequence represents the rhesus monkey wild-type theta defensin RTD-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object compact lens solution, or eye wash solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of growth. Thus the peptides are useful as incrobistatic inhibition of growth. Thus the peptides are useful as microbistatic also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for the infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

defensin analogue peptide aRTD-3-OH.

(first entry)

```
The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD035257. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash colution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbiscatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
                                                                                                                    Monkey, Rhesus theta defensin, RTD; antimicrobial peptide; antimicrobial, antiinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition, microbistatic growth inhibition; disinfectant; food preservative; bacterial inflection; viral inflection; disinfectant; fungal inflection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                              Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.
                                                                                                                                                                                           /note= "Linked to amino acid at position 18 to form a cyclic structure"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                             amino acid at position 1 to form a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash colution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbobicidal inhibition of growth. Thus the peptides are useful as the rapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for the action of the persent defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.
Monkey, Rhesus theta defensin, RTD; antimicrobial peptide, antimicrobial, antinflammatory; antibacterial, virucide, fungicide, food; contact lens solution, eye wash solution, inflammatory response; microbicidal inhibition, microbistatic growth inhibition; disinfectant, food preservative, bacterial infection; viral infection; disinfectant, fungal infection; haemolytic activity; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiancy virus), sexually retracyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
                                                                                                                Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

"MISCELLANBOUS: Functionally this inhibitor is unusual in that it stoichiometrically inhibits trypsin in a molar ratio of 1:2.

"I MISCELLANBOUS: The specificities and functions of this superfamily of inhibitors depend not only on the active sites within the domains, but also upon the amino acid composition, and resulting molecular conformation, surrounding these regions.

"MEGELLANBOUS: Three isoinhibitors are also found whose amino ends differ slightly from that shown.

"MIGHER SIGHTLY: Belongs to the Bowman-Birk serine protease inhibitor

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
